

Timber Restoration & Upgrade

Depending on the extent of the deterioration, Quadriga can often totally restore the strength and load carrying capability of a rotted section quickly and economically using synthetic resins and mortars with stainless steel reinforcement in the form of either bar or plate.

Our methods allow the maximum use of the original timber and are the least disruptive type of repair. We offer repair techniques that allow the English Heritage principles of "preserving as found" and "minimum intervention" to be applied.

The actual method selected will depend on the timber's anticipated load carrying ability.

It is possible to upgrade the loading capacity of entire floors using our techniques at a fraction of the cost of replacement. The minimum interventionist principles of timber upgrading also offer a much more convenient solution to structural problems than more conventional methods.

Restoring A Past. . . Preserving A Future...
