

Waterproofing Systems

The prevention of water penetration into buildings and other structures is an important consideration, particularly where the structures are below ground and at risk from high water tables, water mains, sewage and surface water drains.

Whilst the problems which can arise are well known and a source of inconvenience to building owners, architects, engineers and contractors, the causes are varied and often complex.

Incorrect diagnosis and selection of unsuitable waterproofing systems can prove expensive and very often unsuccessful.

There are a wide range of waterproofing systems available including cementitious rendering, flexible sheet and insitu applied resin membranes, injection sealing and joint details, and their suitability for particular applications can vary considerably.

Quadriga is experienced in many types of waterproofing systems and are approved applicators for most major waterproofing material manufacturers. As such, we are able to recommend and specify appropriate systems to provide cost effective, guaranteed solutions to specific problems.
