

Bird Repellent Systems

The protection of buildings is especially important in areas of large feralbird populations and consideration must be given to the installation of suitable anti-roosting systems either at design stage for new buildings or at planned maintenance intervals for older buildings, which already have established bird problems.

An unprotected building with an established bird problem will eventually suffer erosion of its fabric and unsightly appearance.

These problems are all unwanted and all avoidable.

With timely installation of Quadriga's specialist anti-roosting systems, you can keep birds off your property and maintain its appearance as well as cut maintenance costs and improve living and working conditions for the building inhabitants.

Solutions include:

Sprung Wires, Netting, Needle Strips and Window Guards.
