

Helical Bar Reinforced Repairs

Where masonry has cracked and failed as a result of ground movement, weathering or increased loads and stresses, the Helifix repair system can often provide the ideal solution.

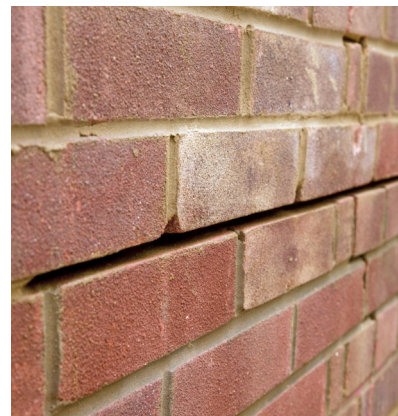

The products in the Helifix Reinforcement System work by tying the unstable masonry together and providing the appropriate level of lateral and vertical restraint to reintroduce structural integrity to the building. Helifix systems allow the building to be repaired, yet left virtually unmarked. Also, in most circumstances, the building occupants can remain within the building while the work is in progress.

Being a Helifix Approved Installer, Quadriga is able to install all the reinforcement systems offered by Helifix efficiently and cost effectively.

Helifix products can be used to provide a range of solutions to structural problems and are indispensable in repairing masonry cracks, stabilising bowed walls into joist sides, and replacing cavity wall ties.

Following a full structural survey and risk assessment, any areas of a building which are considered to be at risk of disproportionate collapse need to be strengthened.

Helifix structural wall ties, fixings and reinforcements, together with their specially developed concealed installation techniques, provide an ideal means of

Restoring A Past. . . Preserving A Future...
