

Concrete Repair

Quadriga is experienced in all forms of concrete repair and is an approved applicator for all the major product manufacturers.

Our staff and operatives have many years experience and are suitably trained to offer a complete service from problem diagnosis and product selection through to careful preparation of steel reinforcement and application of concrete repair mortar to produce a durable repair.

The extent of the repair required will be determined by hammer testing, carbonation depth testing and cover meter survey. Preparation may include grit blasting or powered wire brushing of the corroded reinforcement. Repair techniques include application of polymer-modified mortars, grouts and synthetic mortars, resin injection of cracks and frequently the application of an anti-carbonation protective coating.

Whether to a large scale repair project or small emergency repairs, Quadriga can provide a fast and efficient response to all repair requirements.
